DATE: Revised January 9, 2025

TO: Mr. Alex Pitts, PE, City Engineer – City of Massillon

FROM: Curtis J. Deibel, PE, PTOE, RSP_{2I} – American Structurepoint, Inc.

RE: STA – 21 – 10.46 (PID 122272) Traffic Analysis Memo

1.0 Introduction

American Structurepoint has prepared this memorandum to comprehensively analyze traffic operations at the three signalized intersections along the Lake Avenue corridor within the City of Massillon, Ohio. This traffic analysis will also investigate the crash history along the Lake Avenue corridor and three (3) additional traffic signals along the State Route 21 corridor within the city.

The improvements at these intersections are being considered in conjunction with the STA-21-10.46 (PID 122272) project. This project proposes to improve the Lake Avenue corridor with a combination of pavement reconstruction and/or pavement resurfacing, traffic calming by reducing lane widths, and enhanced pedestrian facilities and crossings between State Route 21 and State Route 241. These enhanced pedestrian facilities include a shared-use path (SUP) to be constructed on the south side of Lake Avenue between State Route 21 and State Route 241 and a traditional sidewalk to be constructed on the north side.

The analysis evaluates existing traffic conditions, primarily focusing on the delay and queueing experienced by vehicles between the two closely spaced signalized intersections along the Lake Avenue corridor at State Route 21 and 1st Street NE. The study includes a capacity analysis using TransModeler 7.0 and HCS2024 to evaluate Level of Service (LOS), delays, and queue lengths for both the existing and proposed conditions. The objective is to determine the preferred alternative at the Lake Avenue & State Route 21 and Lake Avenue & 1st Street NE intersections to minimize queuing between the two (2) intersections and attempt to prevent traffic queues from spilling back into the adjacent intersection.

2.0 Study Area

Lake Avenue is a two-lane urban minor arterial that serves as a key corridor providing access to residential neighborhoods, commercial establishments, and institutional facilities. Lake Avenue is a cut-through for local traffic, connecting the State Route 21 and State Route 241 corridors within the city. Running east-west with a posted speed limit of 25 mph, it features dedicated turn lanes at major intersections to enhance traffic flow and improve operational efficiency.

State Route 21 is a four-lane, divided, urban principal arterial freeway that serves as a key corridor traversing the City of Massillon and is used as an alternate route for I-77 between the Village of Strasburg in Tuscarawas County and the City of Fairlawn in Summit County. It has a posted speed limit of 55 mph through the city. It features dedicated turn lanes at the at-grade signalized intersections to enhance traffic flow and improve operational efficiency.

The Lake Avenue & State Route 21 intersection is signalized, with dedicated left-turn lanes on all four (4) approaches. Additionally, protected-only left turn phasing is provided for the northbound and southbound State Route 21 approaches, while protected-permissive phasing is provided for the eastbound and westbound Lake Avenue approaches.

The Lake Avenue & 1st Street NE intersection is signalized with dedicated left-turn lanes and protected-permissive left turn phasing provided on the eastbound and westbound Lake Avenue approaches.

The Lake Avenue & Amherst Road intersection is signalized with dedicated left-turn lanes and protected-permissive left turn phasing on all four (4) approaches to the intersection.

The State Route 21 & Cherry Road intersection is signalized with dedicated left-turn lanes on all four (4) approaches to the intersection, with dedicated right turn slip lanes on the NB and WB approaches. Additionally, protected-only left turn phasing is provided for the northbound and southbound State Route 21 approaches.

The State Route 21 & Lillian Gish Boulevard intersection is signalized with dedicated left-turn lanes on the SB and WB approaches, with dedicated right turn lanes on the NB and WB approaches. Additionally, protected-only left turn phasing is provided for the southbound State Route 21 approach. Since this is a three-legged intersection, the westbound left turn movement is protected, as there is no opposing movement.

The State Route 21 & Walnut Street intersection is signalized with dedicated left-turn lanes on the northbound, southbound, and eastbound approaches. Additionally, protected-only left turn phasing is provided for the northbound and southbound State Route 21 approaches, while permissive phasing is provided for the eastbound and westbound Walnut Street approaches.

Figure 1 provides an overview of the Lake Avenue study area, displaying the existing lane configurations at the study intersections.

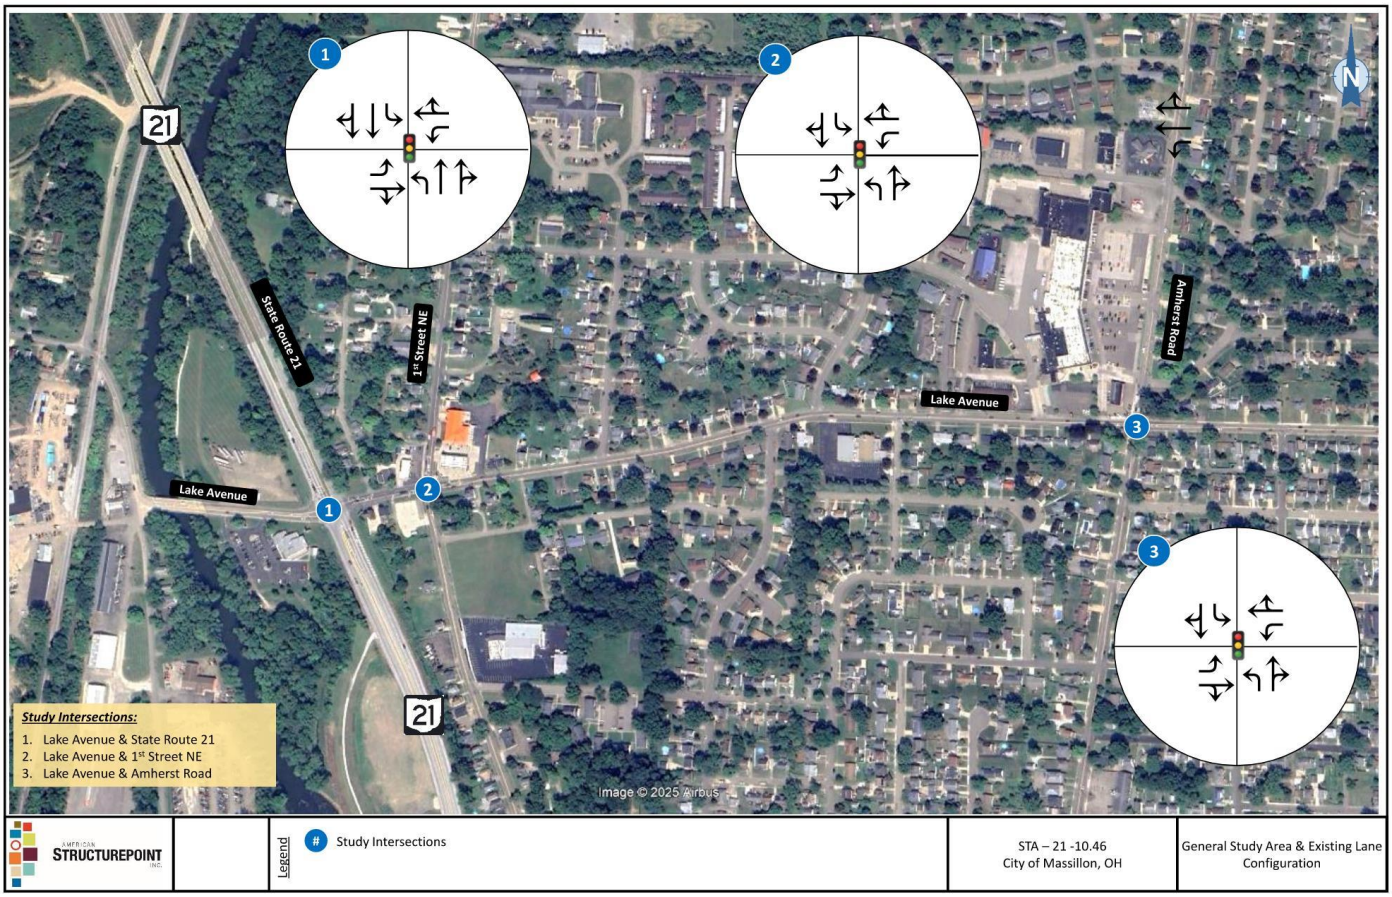

Figure 1: Lake Avenue Study Area Overview

3.0 Traffic Volumes

3.1 Traffic Data Collection

Loukas Engineering collected turning movement counts at all study intersections on Tuesday, April 18, 2025, from 7:00 AM to 7:00 PM. **Attachment A** provides detailed turning movement counts for the study intersections.

3.2 Traffic Volume Projection

Future traffic volumes were developed based on the procedures and tools provided by ODOT's Modeling and Forecasting Methodology. The published peak-hour-to-design-hour volume factors were used based on the functional classification of each roadway and the day of week on which the traffic counts were conducted. These factors account for the variability in traffic on a monthly and daily basis and convert peak-hour traffic counts to the design hour, defined as the 30th-highest hour of the year.

Background traffic growth accounts for a regional increase in traffic, driven by overall population growth and other developments that contribute to higher traffic volumes across the study area. Design Year 2048 traffic projections were developed based on an assumed background growth rate of 0.50% per year, based on discussions that occurred between American Structurepoint and the Stark County Area Transportation Study (SCATS). Future projected ADTs along State Route 21 and Lake Avenue were obtained from ODOT's Traffic Monitoring Management System website. These future traffic volumes were used to calculate the area's growth rate. This information was provided to SCATS, and it was agreed to use a 0.50% annual growth rate for this project. The traffic volumes for the Design Year 2048 are provided in **Figure 2**.

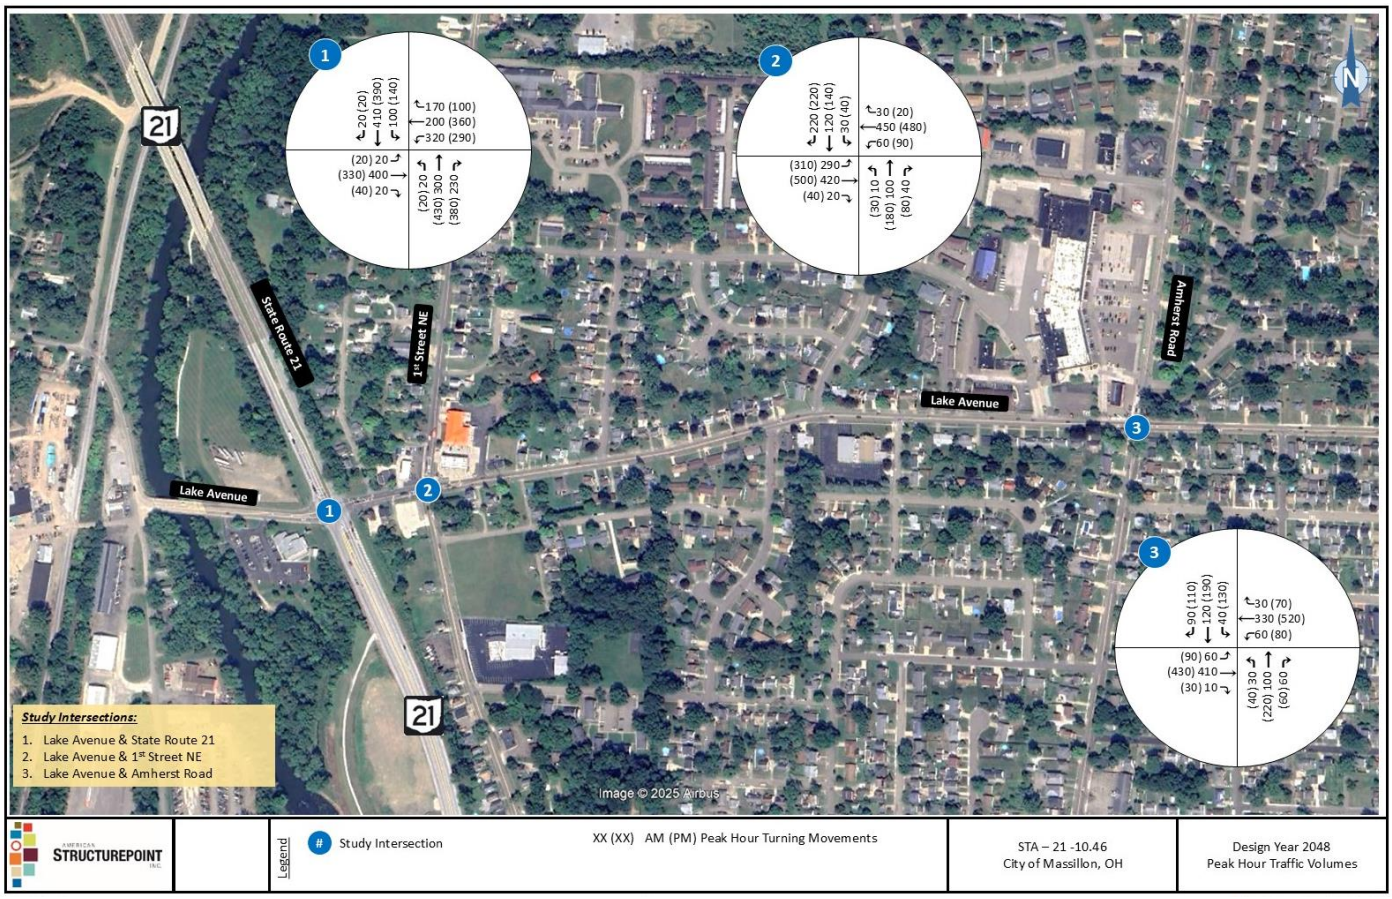

Figure 2: Design Year 2048 Peak Hour Traffic Volumes

4.0 Crash Data and Analysis

4.1 Lake Avenue Corridor

4.1.1 Lake Avenue Crash Data and Diagrams

A total of 81 crashes occurred along the Lake Avenue corridor from January 1, 2022, to December 31, 2024. None of the reported crashes resulted in fatalities, while 2 (2.5%) resulted in serious injuries and 3 (3.7%) in minor injuries. Approximately 89% of the crashes along the Lake Avenue corridor were property-damage-only, making this corridor ineligible for a formal safety funding application to the ODOT HSIP program. The total number of crashes remained consistent across the analysis period, ranging from 26 in 2023 to 28 in 2024. A summary of the crash frequency by type is shown in **Table 1**.

4.1.2 Lake Avenue Crash Causes

Rear-end crashes are by far the most common type of crash in the study corridor. Weather was not cited as a significant contributing factor to the crashes, as only 15% of the crash reports occurred in adverse weather conditions such as fog, rain, snow, or sleet, and only 21% of all crashes listed snow or rain-covered roadways. Poor lighting conditions were not a significant contributing factor, as nearly 85% of the total crashes occurred during daylight hours, generally considered to be 7:00 AM to 6:00 PM. Drugs and alcohol were cited as a contributing factor in less than 2% of the total crashes and should not be considered a significant contributing factor.

4.1.3 Lake Avenue Crash Frequency

The study area has predominantly rear-end crashes, with sideswipe-passing as the second-highest crash type. This large percentage suggests that congestion and lane jockeying on the multilane approaches are significant contributing factors. The collision diagrams are provided in **Attachment B,** and **Table 1** provides percentages for each crash type in the study area.

Table 1: Lake Avenue Crash Type Frequencies

Crash Type	# of Crashes	%
Rear-End	43	53%
Sideswipe – Passing	12	15%
Angle	9	11%
Left Turn	6	8%
Right Turn	5	6%
Fixed Object	3	4%
Backing	1	1%
Parked Vehicle	1	1%
Other Non-Collision	1	1%

Most crashes at the Lake Avenue & State Route 21 and Lake Avenue & 1st Street NE intersections are rear-end and sideswipe–passing crashes caused by congestion. These are common at urban, signalized intersections where vehicles frequently start and stop. Improving traffic flow by increasing capacity could help to mitigate these crashes.

Additionally, there were also angle, left turn, and right turn crashes observed at the two signalized intersections. These types of crashes are common at signalized intersections. They can be related to red light runners, high travel speeds, and driver frustration caused by congestion and not wanting to wait through another signal cycle. Roundabouts have been shown to be an effective strategy for reducing these types of crashes because the one-way travel and curvature of the entries essentially eliminate the possibility of angle, left turn, and head-on collisions.

In addition to the Lake Avenue corridor, three signalized intersections along State Route 21 within the City of Massillon were analyzed for crashes, and crash diagrams were created to investigate potential improvements and funding opportunities. The results are below.

4.2 State Route 21 Corridor

4.2.1 State Route 21 Crash Data and Diagrams

A total of 80 crashes occurred at the Cherry Road, Lilian Gish Blvd, and Walnut Street intersections with State Route 21 from January 1, 2022, to December 31, 2024. None of the reported crashes resulted in fatalities, while 1 (1.3%) resulted in serious injuries and 5 (6.3%) in minor injuries. Approximately 83% of the crashes at these intersections were property-damage-only, making all intersections ineligible for a formal safety funding application to the ODOT HSIP program. The total number of crashes varied across years in the analysis period, from 21 in 2022 to 31 in 2023. A summary of the crash frequency by type is shown in **Table 2**. The crash diagrams are included in **Attachment B**.

Table 2: State Route 21 Crash Type Frequencies

Crash Type	# of Crashes	%
Rear-End	48	60%
Angle	9	11%
Fixed Object	8	10%
Left Turn	7	9%
Sideswipe – Passing	6	8%
Overturing	1	1%
Backing	1	1%

4.2.2 State Route 21 & Cherry Road

A total of 35 crashes occurred at the State Route 21 & Cherry Road intersection from January 1, 2022, to December 31, 2024. None of the crashes reported fatalities, while 1 (2.3%) resulted in serious injuries and 3 (8.5%) in minor injuries. Approximately 89% of the crashes at this intersection were property-damage-only, making it ineligible for a formal safety funding application to the ODOT HSIP program. The total number of crashes has varied slightly across the analysis period, from 9 in 2022 to 14 in 2023.

4.2.3 State Route 21 & Lillian Gish Boulevard

A total of 18 crashes occurred at the State Route 21 & Lillian Gish intersection from January 1, 2022, to December 31, 2024. None of the reported crashes resulted in fatalities, while 5 (27.7%) resulted in minor injuries. Approximately 72% of the crashes at this intersection were property-damage-only, making it ineligible for a formal safety funding application to the ODOT HSIP program. The total number of crashes varied widely across the analysis period, from three in 2022 to 10 in 2023.

4.2.4 State Route 21 & Walnut Street

A total of 27 crashes occurred at the State Route 21 & Walnut Street intersection from January 1, 2022, to December 31, 2024. None of the reported crashes resulted in fatalities, while 5 (18.5%) resulted in minor injuries. Approximately 82% of the crashes at this intersection were property-damage-only, making it ineligible for a formal safety funding application to the ODOT HSIP program. The total number of crashes varied slightly across the analysis period, ranging from seven in 2023 to 11 in 2024.

5.0 Discussion of Alternates

One (1) build alternate was investigated at the Lake Avenue & Amherst Road intersection, while five (5) alternate scenarios were investigated at the Lake Avenue & State Route 21 and Lake Avenue & 1st Street NE intersections to determine which configuration would provide the most efficient operations and reduce the queuing between the two closely spaced intersections. The alternates that were considered are:

5.1 Lake Avenue & Amherst Road Build Alternate

This scenario involves converting the existing signalized intersection into a single-lane roundabout.

5.2 Build Alternate 1

This alternative maintains the existing signalized intersections and lane assignments at both intersections. The improvement scenario will consider modified signal timings and phasing and will function as the No Build option for comparison with the other alternates.

5.3 Build Alternate 2

This alternative involves converting both signalized intersections into roundabouts. The roundabouts should improve operations by reducing average vehicle delay, improving queueing between intersections, and potentially eliminating queue spillback. Numerous sub-alternates were considered with different lane configurations at potential roundabouts.

5.4 Build Alternate 3

This alternative includes constructing a roundabout at the Lake Avenue & 1st Street NE intersection and converting the Lake Avenue & State Route 21 intersection into a signalized Restricted Crossing U-Turn (RCUT) intersection, also known as a superstreet.

5.5 Build Alternate 4

This alternative focuses on enhancing the existing signalized intersections by adding turn lanes at both intersections. This will improve traffic operations, reduce vehicular queuing between the signals, and remain financially constrained. The City of Massillon currently has approximately $4 million in federal funding for this project. Alternate 4 aims to develop an improvement project at these intersections that could be constructed without requiring additional federal funding.

5.6 Build Alternate 5

This alternative also focuses on enhancing the existing signalized intersection at Lake Avenue and State Route 21 by adding turn lanes, while converting the Lake Avenue and 1st Street NE intersection into a single lane roundabout.

6.0 Intersection Capacity Analysis

A comprehensive capacity analysis, or level of service (LOS) assessment, was conducted in accordance with the Highway Capacity Manual (HCM) using both the HCS 2024 software and TransModeler. Due to its isolated location, HCS2024 was used to analyze the Lake Avenue & Amherst Road intersection. Due to their closing spacing, TransModeler was used to analyze the Lake Avenue & State Route 21 and Lake Avenue & 1st Street NE intersections.

This analysis evaluated the Design Year (2048) conditions for the study intersections for each scenario. Since Massillon is within the SCATS MPO, intersection performance was deemed acceptable if the LOS for each intersection was D or better, with no individual approach performing worse than LOS E.

The standard parameter for evaluating traffic operating conditions is the level-of-service (LOS). Six LOS classifications (A through F) relate to driving conditions from best to worst, respectively. LOS for signalized and unsignalized intersections is defined in terms of control delay per vehicle, which directly correlates to driver discomfort, frustration, fuel consumption, and lost travel time. **Table 3** provides the LOS criteria as defined in HCM.

Table 3: Level of Service Criteria for Unsignalized and Signalized Intersections

Level of Service	Control Delay (sec/veh)	
	Unsignalized Intersections	Signalized Intersections
A	≤ 10	≤ 10
B	> 10 and ≤ 15	> 10 and ≤ 20
C	> 15 and ≤ 25	> 20 and ≤ 35
D	> 25 and ≤ 35	> 35 and ≤ 55
E	> 35 and ≤ 55	> 55 and ≤ 80
F	> 50	> 80

6.1 Lake Avenue & Amherst Road Build Alternate

This intersection is signalized with dedicated left turn lanes and protected/permissive phasing provided on all four (4) approaches. This analysis will compare the existing conditions at the intersection with an alternative of converting it into a single-lane roundabout. The capacity analysis shows that the Lake Avenue & Amherst Road intersection is anticipated to operate with acceptable Levels-of-Service on all movements and approaches for the signalized options, with the overall intersection operating at LOS C in both peak hours. As a single lane roundabout, the intersection is anticipated to operate with all movements and approaches at LOS A during both peak hours. Based on the analysis results and observed crashes at this intersection, a roundabout should not be considered, as there does not appear to be a crash concern, and the City recently completed a traffic signal upgrade project in 2024. The intersection is anticipated to operate with acceptable LOS under the Design Year 2048 conditions. **Table 4** summarizes the capacity analysis results at the study intersection, and **Attachment C** contains the HCS intersection capacity analysis printouts.

Table 4: HCS Results Summary - Design Year 2048 Lake Avenue & Amherst Road Build Alternate								
			AM Peak Hour (C= 62.3 sec)			PM Peak Hour (C= 82.4 sec)		
Intersection	Intersection Control	Direction	Delay (s) / LOS	V/C	95th Percentile Queue (ft)	Delay (s) / LOS	V/C	95th Percentile Queue (ft)

		SB Approach	*7.9 / A*			*18.6 / C*		

6.2 Build Alternate 1

In Build Alternate 1, the Lake Avenue and State Route 21 & Lake Avenue, and 1st Street NE intersections will remain signalized with the existing lane geometries and assignments, with new traffic signals assumed due to impacts from constructing the shared-use path along Lake Avenue. These signals would be fully actuated and coordinated to provide the most efficient operations possible while providing progression between the two signals. This build alternate also serves as the No Build comparison, since it is assumed the signals would be improved and retimed by the Design Year 2048. As shown in **Table 5**, the capacity analysis results indicate that this alternative is expected to operate with acceptable Levels of Service, but numerous approaches will operate at LOS E. However, while the Levels-of-Service are acceptable, queuing between the two intersections would continue to be a problem and worsen as the volumes grow. The 95th percentile WB queue at the Lake Avenue and State Route 21 intersection is over 250 feet in both peak hours, with only approximately 225 feet between the two intersections. Additionally, the EB queue at the Lake Avenue and 1st Street NE intersection is over 250 feet in both peak hours. The EB thru movement will have queues of 550 feet in the AM peak hour and 625 feet in the PM peak hour at the Lake Avenue and State Route 21 intersection. Lastly, the WB queue at the Lake Avenue and 1st Street NE intersection is over 600 feet in the AM peak hour. The results from this alternate will be compared to determine the most effective and efficient approach to alleviate the queuing concern at both intersections. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

Table 5: TransModeler Results Summary - Design Year 2048 Build Alternate 1						
Intersection	Intersection Control	Direction	AM Peak Hour (C= 90 sec)		PM Peak Hour (C= 90 sec)	
			Delay (s) / LOS	95th Percentile Queue (ft)	Delay (s) / LOS	95th Percentile Queue (ft)

		SB Approach	*32.7 / C*		*37.2 / D*	

6.3 Build Alternate 2

Build Alternate 2 was split into 2a, 2b, 2c, 2d, and 2e based on different roundabout configurations at the Lake Avenue and State Route 21 & Lake Avenue and 1st Street NE intersection. Roundabouts are being investigated at the two study intersections because they increase traffic flow (approximately 30-50%), reduce delays, and shorten traffic queues, as traffic flows continuously while minimizing stops and idling compared to traffic signals.

In addition to the capacity and queueing benefits, roundabouts also provide significant safety benefits over traditional signalized intersections. The Federal Highway Administration lists roundabouts as one of its 'proven safety countermeasures' due to the safety benefits they provide. When a roundabout replaces a stop sign or traffic signal,

the crash reduction is typically around 40% for overall crashes, 75% for injury crashes, 90% for fatal crashes, and 40 % for pedestrian crashes. This reduction in crashes is related to the following key safety benefits:

- **Lower Travel Speeds** – Roundabouts are typically designed to slow driver speed to 15-20 mph when entering the roundabout, leading to lower travel speeds, and a roundabout is a natural traffic calming measure.
- **Fewer Conflict Points** – A typical four-way intersection has 32 potential conflict points where vehicle paths can cross, while a roundabout reduces this number to just 8, which are mostly merging-type conflicts.
- **Elimination of Dangerous Crash Types** – The one-way travel nature and curvature of the entries essentially eliminate the possibility of angle, left turn, and head-on collisions, which are common at traditional intersections and often result in serious injury or death.
- **Safer for Pedestrians** – Pedestrians only cross one direction of travel at a time, using the splitter islands as a refuge island and reducing the crossing distances.

It should be noted that these safety benefits would apply to all roundabout scenarios proposed as part of this project and are not exclusive to any subalternate under consideration.

6.3.1 Build Alternate 2a

Build Alternate 2a looked at converting both signalized intersections into roundabouts. The initial thought was that the roundabout at Lake Avenue and 1st Street NE would be a single lane roundabout, while a 2x1 hybrid with a WB right turn lane was proposed at the Lake Avenue and State Route 21 intersection. The capacity analysis results, presented in **Table 6**, indicate that acceptable Levels of Service can be achieved at the Lake Avenue and 1st Street NE intersection. However, from a queuing perspective, the EB queue during the PM peak hour is approximately 275 feet, extending into the Lake Avenue and State Route 21 intersection and affecting operations there. The capacity analysis results show that the NB approach to the Lake Avenue and State Route 21 intersection is expected to operate at LOS F, with a queue exceeding 2000 feet during the PM peak hour. The delay on this approach pushes the overall intersection to operate at LOS F during that peak hour as well. These results appear to be tied to the queuing at the Lake Avenue and 1st Street NE intersection. The EB queue in the PM peak hour extends into the Lake Avenue and State Route 21 intersection, adversely affecting operations on that approach and creating the queue shown. Based on traffic volumes and experience, the LOS and delay shown on the NB approach during the PM peak hour are not believed to be a capacity issue at the intersection itself, but rather the queue from the Lake Avenue and 1st Street intersection is impacting operations at this location. An additional build alternate will be analyzed to address queues at Lake Avenue and 1st Street NE to determine if additional capacity is necessary for NB State Route 21 traffic. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

Table 6: TransModeler Results Summary - Design Year 2048 Build Alternate 2a						
Intersection	Intersection Control	Direction	AM Peak Hour		PM Peak Hour	
			Delay (s) / LOS	95th Percentile Queue (ft)	Delay (s) / LOS	95th Percentile Queue (ft)
Lake Avenue and State Route 21	2x1 Hybrid Roundabout with WB Right Turn Lane	***Overall***	***11.9 / B***		***84.1 / F***	
		EB LTR	27.7 / C	475	18.3 / B	225
		EB Approach	*27.7 / C*		*18.3 / B*	
		WB LTR	5.1 / A	125	9.7 / A	225
		WB Approach	*5.1 / A*		*9.7 / A*	
		NB LT	10 / B	100	334.8 / F	2275
		NB R	8.9 / A	50	164.4 / F	2175
		NB Approach	*9.4 / A*		*249.6 / F*

		WB Approach	*5.5 / A*		*9.2 / A*	
		NB LTR	11.2 / B	75	15.3 / B	125
		NB Approach	*11.2 / B*		*15.3 / B*	
		SB LTR	7.2 / A	100	9.3 / A	175
		SB Approach	*7.2 / A*		*9.3 / A*	

6.3.2 Build Alternate 2b

Build Alternate 2b continues to propose converting both intersections into roundabouts. At the Lake Avenue and 1st Street intersection, the TransModeler analysis shows that a single-lane roundabout with an EB left turn lane can provide acceptable LOS C or better for all movements and approaches during both peak hours, while also significantly reducing the queue between the two intersections and improving over the Build Alternate 2a scenario. This alternative would reduce the likelihood of vehicles queuing into the adjacent roundabout at State Route 21, thereby ensuring safe, efficient operations.

The roundabout at the Lake Avenue and State Route 21 intersection was still analyzed as a 2x1 hybrid with a WB right turn lane to provide safe and efficient operations while also ensuring the queue does not back up into the adjacent intersection. As shown in **Table 7**, the roundabout at the Lake Avenue and State Route 21 intersection is anticipated to operate at LOS B or better during both peak hours. The 95th percentile queue in the WB direction is 125' at the most. This alternative also fixes the existing queueing issue, as shown in Build Alternate 1. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

Table 7: TransModeler Results Summary - Design Year 2048 Build Alternate 2b						
			AM Peak Hour		PM Peak Hour	
Intersection	Intersection Control	Direction	Delay (s) / LOS	95th Percentile Queue (ft)	Delay (s) / LOS	95th Percentile Queue (ft)
Lake Avenue and State Route 21	2x1 Hybrid Roundabout with WB Right Turn Lane	***Overall***	***10.6 / B***		***9.2 / A***	
		EB LTR	30.1 / C	400	15.2 / B	225
		EB Approach	*30.1 / C*		*15.2 / B*

6.3.3 Build Alternate 2c

Build Alternate 2c also proposes converting both intersections into roundabouts. The roundabout at the Lake Avenue and 1st Street NE intersection continues to be a single lane roundabout with an EB left turn lane. As shown in **Table 8**, the Lake Avenue and 1st Street NE intersection continues to provide acceptable operations and queuing during both peak hours. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

This analysis assumes the roundabout at the Lake Avenue and State Route 21 intersection is reduced to a single thru lane in the NB and SB directions. Additionally, this roundabout provides a SB left turn lane, NB right turn lane, and WB right turn lane.

Table 8 shows that the roundabout proposed in Build Alternate 2c does not provide acceptable Levels-of-Service during the AM peak hour on the EB approach. This approach is projected to operate at LOS F during the AM peak hour due to the limited gaps in traffic that will exist within the roundabout, which is caused by the heavy SB thru and WB left turn movements funneled into a single lane.

Table 8: TransModeler Results Summary - Design Year 2048 Build Alternate 2c

6.3.4 Build Alternate 2d

Build Alternate 2d continues to propose converting both intersections into roundabouts. The roundabout at the Lake Avenue and 1st Street NE intersection continues to be a single lane roundabout with an EB left turn lane. As shown in **Table 9**, the Lake Avenue and 1st Street NE intersection continues to provide acceptable operations and queuing during both peak hours. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

This analysis assumes the roundabout at the Lake Avenue and State Route 21 intersection is reduced to a single thru lane in the NB direction with two thru lanes in the SB direction. Additionally, this roundabout provides a NB right turn lane and a WB left turn lane, which aligns with the existing travel patterns.

Table 9 shows that the proposed roundabout at the Lake Avenue and State Route 21 intersection operates with acceptable Levels-of-Service and queueing during both peak hours for this alternative. These results show that the EB approach has the highest delay and queuing, with LOS C in the AM peak hour and a queue length of 450', a reduction from the 550' shown in the Build Alternate 1 conditions, which serves as the No Build.

Table 9: TransModeler Results Summary - Design Year 2048 Build Alternate 2d						
			AM Peak Hour		PM Peak Hour

		SB LTR	6.6 / A	100	9.3 / A	100
		SB Approach	*6.6 / A*		*9.3 / A*	

Based on the results of Build Alternate 2d, it was requested that an interim condition be investigated to open the roundabout with a smaller footprint, to be expanded in the future once queuing and delays at the intersection became problematic. This smaller roundabout configuration would eliminate the second WB lane entering the roundabout. **Table 10** contains the Opening Year 2028 analysis for the Build Alternate 2d Interim conditions.

The roundabout at the Lake Avenue and 1st Street NE intersection continues to be a single lane roundabout with an EB left turn lane, which has been found to provide acceptable operations and queuing at the intersection. The results also show that the Lake Avenue and State Route 21 intersection is anticipated to operate with all movements and approaches at LOS B or better, with the WB queue at State Route 21 being 175' in both peak hours. This analysis shows that this roundabout configuration can accommodate the Opening Year 2028 traffic demand from both a delay and queueing perspective.

Table 10: TransModeler Results Summary - Opening Year 2028 Interim Build Alternate 2d						
			AM Peak Hour		PM Peak Hour	
Intersection	Intersection Control	Direction	Delay (s) / LOS	95th Percentile Queue (ft)	Delay (s) / LOS	95th Percentile Queue (ft)

		SB LTR	6.5 / A	75	7.5 / A	100
		SB Approach	*6.5 / A*		*7.5 / A*	

Once it was determined that the Build Alternate 2d Interim configuration could accommodate the Opening Year 2028 traffic demand, an additional analysis was conducted to assess the interim configuration under Design Year 2048 conditions. **Table 11** presents the results of this analysis for the Design Year 2048 conditions.

The roundabout at the Lake Avenue and 1st Street NE intersection continues to be a single lane roundabout with an EB left turn lane, which has been found to provide acceptable operations and queuing at the intersection. These results also show that the Lake Avenue and State Route 21 intersection is anticipated to operate with all movements and approaches at LOS C or better during the AM peak hour and LOS B or better during the PM peak hour. However, the results show that the queue on the WB approach is anticipated to be 250', which exceeds the maximum queue length available between the two intersections. These results indicate that while the interim condition for Build Alternate 2d can accommodate the Opening Year 2028 conditions, it does not provide adequate operations at the Lake Avenue and State Route 21 intersection into the Design Year 2048 conditions. If the City of Massillon chooses to build the roundabout using the Interim Build Alternate 2d condition, it will need to be upgraded to the full Build Alternate 2d configuration if future traffic volumes increase as projected.

Table 11: TransModeler Results Summary - Design Year 2048 Interim Build Alternate 2d

		SB Approach	*7.4 / A*		*8.9 / A*	

6.3.5 Build Alternate 2e

Build Alternate 2e continues to propose converting both intersections into roundabouts. The roundabout at the Lake Avenue and 1st Street NE intersection continues to be a single lane roundabout with an EB left turn lane. As shown in **Table 12**, the Lake Avenue and 1st Street NE intersection continues to provide acceptable operations and queuing during both peak hours. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

This analysis assumes the roundabout at the Lake Avenue and State Route 21 intersection is reduced to a single thru lane in the NB and SB directions. Additionally, this roundabout provides a SB left turn lane, NB right turn lane, and WB left turn lane.

Table 8 also shows that the roundabout proposed in Build Alternate 2c does not provide acceptable Levels-of-Service during the AM peak hour on the EB approach. This approach is projected to operate at LOS F during the AM peak hour due to the limited gaps in traffic that will exist within the roundabout, which is caused by the heavy SB thru and WB left turn movements funneled into a single lane.

Table 12: TransModeler Results Summary - Design Year 2048 Build Alternate 2e

		SB Approach	*7.2 / A*		*9.2 / A*	

6.3.6 Build Alternate 3

In Build Alternate 3, the Lake Avenue and State Route 21 intersection is converted to a signalized RCUT, with signalized U-turns located north and south of the main intersection. This allows the side street left, side street through, and mainline left turning traffic to complete their desired movements. This analysis assumes NB and SB right turn lanes are being constructed at the main intersection to accommodate the additional right turns for those movements, along with NB and SB left turn lanes at the U-turn intersections.

Table 13 below summarizes the capacity analysis results at the study intersection for Build Alternate 3. Please note that the results in this table are the control delay associated with each traffic signal. This does not account for the additional travel time associated with certain movements during the RCUT reroute. The capacity analysis results show that the proposed RCUT at the Lake Avenue and State Route 21 intersection and a roundabout at Lake Avenue and 1st Street NE intersection do not provide acceptable Levels-of-Service under the Design Year 2048 traffic conditions. The capacity analysis shows that the WB left of the Lake Avenue and 1st Street NE roundabout is expected to operate at LOS F, with a significant queue length resulting from queuing at the Lake Avenue and State Route 21 intersection. The proposed RCUT intersection does create the potential for additional rear-end crashes occurring along the State Route 21 corridor due to the introduction of two (2) additional traffic signals at the U-turn locations. There is currently a SB rear-end crash pattern at the Lake Avenue and State Route 21 intersection, and a similar pattern would be

expected if the RCUT is constructed. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

6.3.7 Build Alternate 4

In Build Alternate 4, the existing intersections will remain signalized, with additional turn lanes constructed to improve traffic operations, reduce queue lengths, and allow the project to be built with the existing federal funds secured for this project. The traffic analysis assumed that three turn lanes would be constructed, providing the most significant operational benefit and queue reduction. At the Lake Avenue and State Route 21 intersection, a WB right turn lane with an associated right turn overlap phase is being proposed. EB and SB right turn lanes are also proposed at the Lake

Avenue and 1st Street NE intersection. **Table 14** summarizes the capacity analysis results at the study intersections for Build Alternate 4. The signalized intersections are expected to operate with less overall delay and queuing; however, the queue length is minimally reduced, and this alternative will not significantly improve the operations between these two intersections. It should be noted that additional lane configurations were considered for this scenario, and the configuration shown below provided the best results in queuing at the signalized intersections. One lane configuration that was analyzed included dual WB left turn lanes at the Lake Avenue and State Route 21 intersection. However, the inclusion of dual left turn lanes necessitated that the left turn phasing for this approach be either protected only or side street split phasing, neither of which improved the queuing to the extent shown below. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

Table 14: TransModeler Results Summary - Design Year 2048 Build Alternate 4

6.3.8 Build Alternate 5

In Build Alternate 5, the Lake Avenue and State Route 21 intersection will remain signalized with additional turn lanes constructed to improve traffic operations, while the Lake Avenue and 1st Street intersection is converted to a single lane roundabout with the EB left turn lane, similar to most other scenarios presented in this memo. The traffic analysis assumed that an additional WB left and right turn lane would be added to the Lake Avenue and State Route 21 intersection, along with converting the WB left turn phase to protected only due to the dual left turn movement. As shown in **Table 15**, the proposed single lane roundabout with an EB left turn lane is anticipated to provide acceptable Levels-of-Service and queuing at the Lake Avenue and 1st Street intersection as a roundabout. The improved traffic signal at the Lake Avenue and State Route 21 intersection is anticipated to operate with all movements at LOS E or better and all approaches at LOS C or better under the Design Year 2048 conditions. The queueing is also found to be acceptable with the WB queue reaching a maximum of approximately 200' in the PM peak hour. Please see **Attachment D** for the TransModeler analysis printouts for this alternative.

Table 15: TransModeler Results Summary - Design Year 2048 Build Alternate 5

7.0 Final Alternate Configurations and Estimates

Based on the capacity analysis results, the following lane configuration is recommended for each alternative analyzed. **Attachment E** contains an exhibit to depict each alternate, and **Attachment F** contains a preliminary cost estimate for each.

Build Alternate 1 (Signal / Signal Option) – This build alternative served as the No Build scenario for signal operations and lane configurations comparison. Since no geometric improvements are being made as part of this alternative, there is limited safety benefit, and the capacity results indicate that the current queueing issue will persist and worsen over time as volumes continue to increase along both corridors. This alternative was eliminated from consideration due to its limited safety benefits and its inability to accommodate future capacity or queuing needs at the intersections. The total estimated cost of this alternative is approximately $2.4 million.

Build Alternate 2 (Roundabout / Roundabout Option) – Build Alternate 2 was split into Alternates 2a-2e to investigate further which roundabout options could provide acceptable capacity and queueing results in the future. These configurations also have their own pros and cons, depending on the safety differences between them.

Build Alternate 2a proposes to construct a 2x1 hybrid roundabout at the Lake Avenue and State Route 21 intersection and a single lane roundabout at the Lake Avenue and 1st Street NE intersection. Converting the two intersections into roundabouts will provide a substantial safety benefit over the existing signalized intersection, and the roundabout does not contain any 2-lane by 2-lane nodes, which can sometimes raise safety concerns. However, this roundabout has two thru lanes on NB and SB State Route 21, which could become an issue due to high truck volumes on State Route 21 and the possibility of two trucks entering the roundabout side-by-side. This alternate has been eliminated from consideration because the capacity analysis results show it does not provide adequate capacity or queue storage between the two intersections. The total estimated cost of this alternative is approximately $6.9 million.

Build Alternate 2b proposes to construct a 2x1 hybrid roundabout at the Lake Avenue and State Route 21 intersection and a single lane roundabout with a left turn lane at the Lake Avenue and 1st Street NE intersection. This alternate presents the same safety pros and cons as Build Alternate 2a, and the additional EB left turn lane through the Lake Avenue and 1St Street NE intersection is not anticipated to present any additional safety concerns since the Lake Avenue corridor has such a low percentage of trucks. The capacity analysis results show that this alternate provides adequate capacity at both intersections, and the queue is not expected to spill over into the adjacent roundabout. For this reason, it was determined that Build Alternate 2b is a viable improvement option and should be considered by the City of Massillon. The total estimated cost of this alternative is approximately $8.0 million.

Build Alternate 2c was created to investigate if it was possible to eliminate the two thru lanes NB and SB at the Lake Avenue and State Route 21 intersection. This alternative proposes constructing a single lane roundabout with EB left turn lane at Lake Avenue and 1st Street NE. The roundabout at the Lake Avenue and State Route 21 intersection provides one thru lane in the NB and SB direction, a SB left turn lane, a NB right turn lane, and a WB right turn lane. This alternate eliminates the safety concern of having two thru lanes entering the roundabout on the NB and SB approaches, while still providing the traditional safety benefits of a roundabout vs. a signalized intersection. The capacity analysis results show that this alternative fails for the EB approach during the AM peak hour due to limited gaps created and heavy SB thru and WB left movements in the roundabout, which have eliminated this alternate from consideration. The total estimated cost of this alternative is approximately $8.0 million.

Build Alternate 2d was created to provide additional capacity at the Lake Avenue and State Route 21 roundabout to address the capacity issue in Build Alternate 2c. This roundabout configuration contains two SB thru travel lanes, one NB thru lane, a NB right turn lane, a WB left, and a WB shared left-thru-right lane. Based on the capacity analysis results shown earlier in the memo, this alternative can accommodate future traffic demand with acceptable Levels of Service and minimal queuing at both intersections. This alternate

provides the safety benefit of a single thru lane in the NB direction, which is an improvement over Build Alternate 2b. However, this alternate does have two SB travel lanes merging into two lanes in the WB direction, creating additional conflict points at the SB entry. For this reason, it was determined that Build Alternate 2d is a viable improvement option and should be considered by the City of Massillon. The total estimated cost of this alternative is approximately $8.0 million.

Build Alternate 2d Interim was created to see if SB entry conflict points could be eliminated by having a single WB approach lane into the Lake Avenue and State Route 21 intersection. The capacity analysis results show that this configuration is viable under the Opening Year 2028 traffic conditions but fails under the Design Year 2048 conditions. This interim roundabout provides the safety benefits of a roundabout vs. a signal, has one NB travel lane through the Lake Avenue and State Route 21 roundabout, and reduces the conflict points at the SB and WB entry points. Additionally, this roundabout could be built to the full Build Alternate 2d roundabout, and the additional WB left turn lane and circulating lane within the roundabout could be striped out until it's needed in the future, should the traffic volume projections be realized. For this reason, it was determined that Build Alternate 2d is a viable short-term improvement option and should be considered by the City of Massillon, recognizing that the roundabout will need to be expanded in the future to accommodate Design Year traffic volumes. The total estimated cost of this alternative is approximately $8.0 million.

Build Alternate 2e was created to avoid having two SB travel lanes through the roundabout at Lake Avenue and State Route 21. This configuration has single NB and SB travel lanes, a SB left turn lane, a NB right turn lane, a WB left, and a WB shared left-thru-right lane. This configuration eliminates the two SB travel lanes on State Route 21, which is a safety benefit for this alternate, but still contains conflict points and potentially confusing lane assignments at the SB entry point. Capacity analysis results show this alternative has the same issue at Build Alternate 2c, where the EB approach during the AM peak hour fails due to limited gaps created and heavy SB through and WB left movements. For this reason, this alternate has been eliminated from consideration. The total estimated cost of this alternative is approximately $8.0 million.

Build Alternate 3 (RCUT / Roundabout Option) – Build Alternate 3 proposes creating a signalized RCUT intersection at the Lake Avenue and State Route 21 intersection, with signalized U-turn locations on both the north and south sides of the main intersection, allowing side-street left- and through-traffic to complete their desired movements. This build alternative assumes that NB and SB right turn lanes are being constructed at the central intersection location, and NB and SB left turn lanes are being built at the U-turn intersections. The proposed RCUT intersection would help to alleviate left turn and angle crashes at the Lake Avenue and State Route 21 intersection as a safety improvement. However, it also creates the potential for additional rear-end crashes occurring along the State Route 21 corridor due to the introduction of two (2) additional traffic signals at the U-turn locations. There is currently a SB rear-end crash pattern at the Lake Avenue and State Route 21 intersection, and a similar pattern would be expected if the RCUT is constructed. The capacity analysis results show that Build Alternate 3 does not provide acceptable Levels of Service, with the WB left at the Lake Avenue and 1st Street NE roundabout anticipated to operate at LOS F, resulting in significant queue lengths from the Lake Avenue and State Route 21 intersection. For this reason, this alternate has been eliminated from consideration. The total estimated cost of this alternative is approximately $6.8 million.

Build Alternate 4 (Widened Signal / Signal Option) – Build Alternate 4 proposes widening the two intersections to provide additional turn lanes to improve operations and reduce queuing, while continuing to operate the intersections under signal control. This build alternative proposes constructing a WB right turn lane at the Lake Avenue and State Route 21 intersection while also constructing EB and SB right turn lanes at the Lake Avenue and 1st Street intersection. While this alternative does not alleviate the queueing between the two intersections, its goal was to improve operations and queueing at the intersection, delivering a project that could be funded with the City of Massillon's existing SCATS funding without additional funds. This project provides limited safety benefits as the intersections will remain signalized. The reduced queueing created by the new turn lanes could help to alleviate some congestion-related rear-end crashes; however, this alternate does not address crash types that are more likely to lead to serious injury or fatal crashes, like angle and left turn crashes. Since this alternative does not provide acceptable Levels of Service or queueing between the two intersections, it has been eliminated from consideration. The total estimated cost of this alternative is approximately $4.3 million.

Build Alternate 5 (Widened Signal/Roundabout Option) - Build Alternate 4 proposes widening the Lake Avenue and State Route 21 intersection to add turn lanes, improving operations, and reducing queuing. Additionally, this alternative proposes converting the Lake Avenue and 1st Street NE intersection into a single lane roundabout with an EB left turn lane. This alternate provides a significant safety benefit to the Lake Avenue and 1st Street NE intersection by converting it to a roundabout. However, with the Lake Avenue and State Route 21 intersection remaining signalized, the improvement provides minimal safety benefit. Based on the capacity analysis results shown earlier in the memo, this alternative can accommodate future traffic demand with acceptable Levels of Service and minimal queuing at both intersections. Even though this alternate does not provide as substantial a safety benefit or capacity improvement as other viable alternatives, it should still be considered by the City of Massillon, as it accomplishes the goals of this project. The total estimated cost of this alternative is approximately $5.7 million.

These intersection alternatives are being considered in conjunction with the Lake Avenue improvement project. The costs discussed above apply only to the intersection improvements. The Lake Avenue corridor project, which includes roadway resurfacing, traffic calming through reduced lane widths, a shared-use path on the south side of the roadway, and a sidewalk on the north side, would be in addition to the cost of each alternative and has a current estimated cost of $6.5 million.

8.0 Summary and Recommendation

Based on the capacity and queuing analysis results, Build Alternates 2b, 2d, and 5 were deemed viable options to address the queuing concerns along the Lake Avenue corridor between the State Route 21 and 1st Street NE intersections. The capacity analysis results show that the improvements associated with Build Alternates 1, 2a, 2c, 2e, 3, and 4 are not sufficient to provide acceptable Levels-of-Service or queuing space in future conditions with unacceptable Levels-of-Service and/or queuing between the two intersections projected in each scenario.

Based on the information contained in this memo, the full build version of Build Alternate 2d is recommended to the City of Massillon for advancement to the design and funding phase of this project, pending the outcome of the public involvement process, which is required for a project of this type. This alternative is recommended over the others after considering vehicular safety, pedestrian safety, operational improvements, consistency for drivers, right-of-way impacts, and project cost. An additional consideration when selecting the preferred alternate is the pedestrian crossing at the Lake Avenue and State Route 21 intersection. The traffic signal in Build Alternate 5 poses a safety concern due to a long crossing distance, which can affect signal timings and queueing, and potential line-of-sight issues with traffic not seeing pedestrians in a crosswalk as they make the turn. The roundabout provides a shorter, two-stage crossing, fewer conflict points, slower travel speeds, and the need to cross only in one direction at a time.

Attachment G presents the comparison matrix, created for inclusion in the public involvement process. For simplicity, in the comparison matrix, Alternate 2d is called Alternate 2. Since this memo is available for the public meeting and went into detail on the other subalternates, the other dual roundabout alternates were not presented. Still, they will be discussed at the public meeting. This matrix will help residents of the City of Massillon and stakeholders understand the factors that went into the decision-making process.

While a funding gap exists between the federal funds secured and the project's overall cost, the City of Massillon has secured a significant portion of those funds after being awarded $4.15 million from the SCATS STBG funding program. Additionally, the City of Massillon has a pending application to the ODOT Highway Safety Improvement Program for $2 million in systemic safety program funding for pedestrian enhancements and safety improvements associated with this improvement project. American Structurepoint will continue working with the City of Massillon to identify further funding opportunities and help reduce the city's local share for this project.

HCS Roundabouts Report

General Information

Analyst	CJD
Agency or Co.	ASI
Date Performed	5/13/2025
Analysis Year	2048
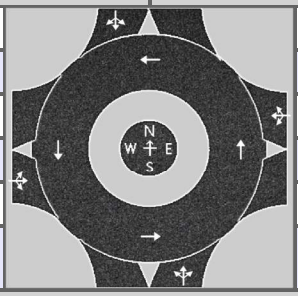
Time Analyzed	PM Peak Hour
Project Description	STA - 21 - 10.46



Site Information

Intersection	Lake Avenue / Amherst Road
E/W Street Name	Lake Avenue
N/S Street Name	Amherst Road
Analysis Time Period, hrs	0.25
Peak Hour Factor	0.97
Jurisdiction	Massillon

Volume Adjustments and Site Characteristics

Approach	EB				WB				NB				SB			
Movement	U	L	T	R	U	L	T	R	U	L	T	R	U	L	T	R
Number of Lanes (N)	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0
Lane Assignment			LTR				LTR				LTR				LTR

Project:	Alt 2c_SR-21 & Lake Ave_RABx2
Scenario:	2048 PM Peak Hour
Run(s):	Batch (10 runs)
Simulated:	Various
Time:	15:30:00 - 16:30:00
Interval:	15 min
Selection:	print

Roundabout Level of Service by Lane - Overview

55108, 55114, 55110, 55112, 55107, 55113, 55109 & 55111 -- ROUNDABOUT **NODE: 7**

Interval	Run	Number of Vehicles	Total Control Delay (hr)	Avg Control Delay (sec/veh)	Level of Service

General:

- In providing estimates of probable construction cost, the Client understands that the Consultant has no control over the cost or availability of labor, equipment or materials, or over market conditions or the Contractor's method of pricing, and that the Consultant's opinions of probable construction costs are made on the basis of the Consultant's professional judgment and experience. The Consultant makes no warranty, express or implied, that the bids or the negotiated cost of the Work will not vary from the Consultant's opinion of the probable construction cost.
- The estimate is taken from the historical bid data provided by ODOT for the year 2025.
- For items where historical bid data provided by ODOT was not available, other similar bid data sources were used to determine costs.
- Applied 30% Design Contigency and 11.6% Inflation (ODOT CY 2025-2029 Business Plan Inflation Calculator)

Assumed Roadway Pavement Buildup (Full Depth Areas Only):
- 1.25" Item 441 - Asphalt Concrete Surface Course, Type 1, (449), PG70-22
- 1.75" Item 441 - Asphalt Concrete Intermediate Course, Type 2, (449)
- 9" Item 301 - Asphalt Concrete Base, PG64-22, (449)
- 6" Item 304 - Aggregate Base

Assumed Shared-Use Path Pavement Buildup:
- 1.25" Item 441 - Asphalt Concrete Surface Course, Type 1, (448), PG64-22
- 1.75" Item 441 - Asphalt Concrete Intermediate Course, Type 2, (448)
- 6" Item 304 - Aggregate Base

Assumed Roundabout Parameters:
- Lake/SR-21 RAB - 120' ICD
- Lake/1st RAB - 110' ICD
- Lake/Amherst RAB - 90' ICD

Assumed Subgrade Stabilization:
- Undercut and Replace for 20% of the Project Limits

Lake Avenue Corridor Improvements (A-Lake/Amherst Signal)
- Minimum two permanent ROW takes on south side of roadway due to new horizontal curve at Lake/Keuper
- Retaining wall likely along sidewalk on north side of roadway to minimize grading impacts to residential properties between Amherst to 8th
- Retaining wall likely along SUP on south side of roadway to minimize grading impacts to residential properties between Amherst to 10th

Lake Avenue Corridor Improvements (B-Lake/Amherst RAB)
- Same corridor bulletpoints
- 1 Total Take (Residential) involving 1 Structure Take at SE quadrant of Lake/Amherst

Alternative 1:
- Signal upgrades to accommodate SUP

Alternative 2A:
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 2B Original:
- 2 Total Takes (1 Residential, 1 Commercial) involving 2 Structure Takes on south side of Lake
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 2B Shifted South, 2C, 2D, 2E
- 3 Total Takes (2 Residential, 1 Commercial) involving 3 Structure Takeson south side of Lake
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 3A:
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 3B:
- 2 Total Takes (1 Residential, 1 Commercial) involving 2 Structure Takes on south side of Lake
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 4:
- 3 Total Takes (2 Residential, 1 Commercial) involving 3 Structure Takes on south side of Lake
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Alternative 5:
- 3 Total Takes (2 Residential, 1 Commercial) involving 3 Structure Takes on south side of Lake
- 1 Total Take (Commercial) involving 2 Billboard Takes at SE quadrant of Lake/SR-21

Vehicle Safety Improvement												
Improves Traffic Operations												
Increases Safety for Pedestrian Crossing SR 21												
Right-of-Way Impacts												
Cost												
Performance Summary			• Vehicle queuing lengths expected to extend to adjacent intersections • Poor traffic operations with long queueing • Significant WB queue at 1st Street in the morning peak hour • Minimal improvement to pedestrian or vehicle safety		• Provides the best traffic operations (LOS A) and queue lengths are expected to reduced significantly • Provides shorter and safer pedestrian crossing at SR 21 and Lake Ave • Improves overall intersection safety for pedestrians and vehicles		• Improved traffic operations but queuing into 1st street is still expected resulting in poor roundabout operations • Provides moderate vehicle and pedestrian safety improvements however RCUT adds two additional signals to SR 21 creating potential for additional crashes • SR 21 pedestrian crossing not as safe as roundabout option		• Similar to Alternative 1 with slightly better traffic operations but queuing is still expected to back up into adjacent intersections		• Provides acceptable traffic operations and queue lengths are expected to be reduced significantly • Requires queue detention to minimize queen lengths between intersections resulting in potentially longer delays on SR 21 • Moderate safety improvements for vehicles but would require a long pedestrian crossing at SR 21, potentially leading to safety issues

95th% Queue exceeds segment storage capacity

Operates with acceptable LOS and queuing capacity

Movement LOS E/F

GOOD FAIR POOR
